

Ensim Unify Managed Edition

Benefits

Reduced operating expenses for managed deployments
Centralized management of disparate infrastructures through a single solution
Increased ARPU (Average Revenue Per User)
Easy integration and extensibility

Supported applications

Microsoft Active Directory
Exchange 2003 / 2007
BlackBerry Enterprise Server

Supported devices

Windows Mobile
Smartphones
BlackBerry

"The need for comprehensive, flexible, and easy to configure unified communications (UC) provisioning services is a growing requirement for organizations grappling with diverse systems. A service provider grade solution that offers the least disruption to the existing infrastructure will enable enterprises to improve productivity, lower the cost of UC ownership, and reduce the burden on information technology departments."

*Karen Hobert,

Ensim Unify Managed Edition enables service providers to easily manage an infinite number of dedicated deployments via a single management center. With a core focus on unified communications, messaging, and collaboration, Unify Managed Edition streamlines the management of mission-critical applications that are used by nearly every employee. Further, Unify's comprehensive pre-built connectors lower operating expenses and expand revenue opportunities. Today, Unify Managed Edition supports Microsoft Active Directory, Exchange, and BlackBerry Enterprise Server.

Meeting challenges in managed deployments

In a fast-changing global economy, service providers who manage customer environments are continuously challenged. They must adapt to integrate new technologies and meet rising customer expectations, and they must manage an increasing number of dedicated environments with the same tools and often, the same number of people. Satisfying this growing market requires a combination of processes and commercially available software that both conserves resources and enables services providers to do more with less.

Fortunately, Ensim Unify Managed Edition addresses these formidable challenges. It simultaneously reduces operating costs, centralizes the secure management of disparate dedicated environments, and extends current offerings to easily include new managed applications.

Solution from a global leader

Ensim is the leading provider of software and systems that automate provisioning, enable delegated administration, and streamline application management.

Ensim allows managed-service providers to:

- Reduce operational costs
- Increase ARPU (Average Revenue Per User)
- Easily integrate and extend offerings to meet tomorrow's needs

Reducing operational costs

Provisioning and change-management automation - for user accounts, groups and devices.
Role-based delegated administration - a powerful management system that enable service providers to define custom roles for various administrator levels, all the way down end-users, for tasks such as password reset or Smartphone configuration.
Infrastructure optimization - a single solution for managing and controlling multiple instance of dedicated environments.

Increasing ARPU

Unify Managed Edition enables service providers to focus their attention on market share, knowing that a new customer can easily be integrated within their existing management center, allowing for quick time-to-launch and minimizing operational and help-desk training.

Integrating and extending offerings easily

Unify Managed Edition comes with a standardized Web Services API, allowing service providers to easily integrate existing tools and applications. In addition, Unify can be extended to manage any device or application through its comprehensive SDK."
