

## Securely Provision, Administer and Manage Active Directory

Active Directory is an efficient repository for users, computers, groups, printers, applications, and other directory-enabled objects. It provides a centralized location for configuration, authentication and storage of these objects. While Active Directory solves a lot of issues, it imposes a lot of administration and management challenges for IT administrators. In large complex windows environments creating and managing user objects manually is time consuming, non-standard and prone to mis-configurations. Additionally administrators are usually granted elevated privileges or share across multiple users and groups making your directory systems vulnerable to security breaches and difficult to enforce business rules and compliance policies.

Ensim Unify Active Directory (AD) Manager is an integrated tool for fine grain entitlement assignment, designed to protect and secure your AD infrastructure. With one-click template based provisioning your users are quickly setup while enforcing standardization with seamless management of business IT policy across your enterprise. Ensim Unify granularly enables the delegation of provisioning and management of various AD objects to junior IT members, department administrators, business managers or end-users through a user-friendly web interface. With Ensim Unify, administrators can create as many roles as deemed necessary, each with different capabilities. User provisioning and delegated administration capabilities from Unify keep AD safe and at the same time decrease IT overhead while increasing end user productivity.

“The native tools we looked at were static and only available on the work station or server you have to log into. With Ensim, we can log into a web browser and configure anything we need to. It’s simple, flexible remote management across all our offices.”

Francis Marques,  
Network Administrator  
Marks, O’Neill,  
O’Brien & Courtney”

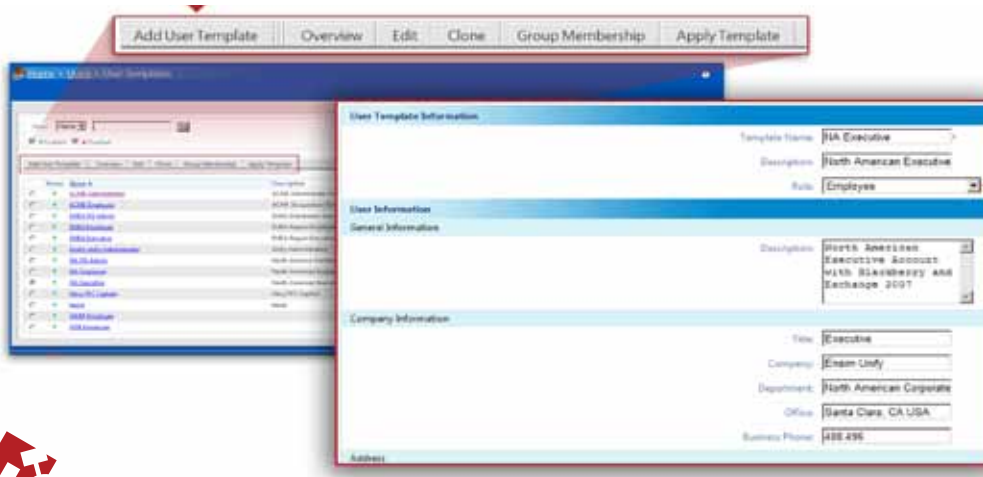

With rich template capabilities, not only are administrators able to minimize mis-configuration, but also enforce business processes, entitlements and standardization across all user management. Custom rules and naming conventions can be easily applied to newly provisioned user accounts through a simple web-based administrative interface. Complex termination policies can be automated through simple de-provisioning configuration options.

**Role-based delegated administration:** Ensim Unify allows granular setup on any number of administrative accounts for multi-roles such as junior IT, HR and help desk using our role based delegated administration. There becomes no need to worry about giving elevated access through native interfaces.

**Audit, Compliance & Security Logs:** Ensim Unify provides a full audit log of all Active Directory updates. Administrators can query and save various reports of AD changes to any AD object, or updates performed by an administrator. Alternatively a comprehensive report of all updates within a specific time frame can be executed. All audit and compliance reports can be exported for further integration with an enterprise's business systems.

**Computer Account Management:** Administrators can now use Unify AD Manager for bulk management of computer accounts or printers in AD. Multiple computer accounts can be updated to manage their group memberships, enable/disable accounts or other account attributes. Moving one or more computer accounts has been simplified to a single point and click operation.

**Group Management:** Ensim Unify provides a comprehensive web-based group management tool enabling administrators to easily manage and control their entire repository of security and distribution groups. This includes creating, modifying, deleting, enforcing naming conventions, expiring accounts, approval management and permission management.
